

Banking customer analytics.

Customer scale, lending mix, credit-score distribution, geography, and retention signals from the supplied dashboard.

EXECUTIVE READOUT

Directional evidence, disciplined next steps.

The dashboard shows a large customer base and loan book, broad lending reach across gender segments, a meaningful retention gap, and a visible concentration in lower credit-score bands.

Prepared for banking and analytics decision-makers.

The portfolio is large, but the dashboard scope needs a data check.

The scale is clear. The definitions are not yet clean enough for broad generalization.

Metric

Portfolio KPIs · the city KPI duplicates the customer KPI and requires validation.

WHAT IS KNOWN

279,856 customers

Reported total loan amount:
29,607,461,447.

SCOPE CAVEAT

The Software Engineer occupation is highlighted. Occupation-specific findings should not be generalized to the full customer base until the filter scope is confirmed.

Loan exposure is almost evenly split by gender.

Male and female customers account for nearly equal shares of total loan amount.

Loan share by gender · source-backed percentages.

48%

MALE

47%

FEMALE

5%

OTHER

The narrow 1-point gap between male and female segments suggests broad product reach rather than a single-gender lending concentration.

Retention is the clearest near-term opportunity.

The dashboard shows a 20 percentage-point gap between non-existing and existing customers.

Customer status

Existing-customer split · validate the customer-status definition before targeting conversion.

EXISTING CUSTOMERS

40%

Current relationship base.

NON-EXISTING CUSTOMERS

60%

Largest visible relationship-deepening opportunity.

The next question is not whether the gap exists, but how the 60% non-existing group should be segmented by product need, eligibility, and next-best offer.

Lower credit-score bands carry the largest visible customer counts.

The lowest visible band is the largest; the pattern is directional until the underlying data is available.

Credit score band

Customers by credit-score band · approximate values read from chart heights.

LARGEST VISIBLE BAND

≈9,000

Customers in the 300–499 band.

Other visible bands range from approximately 3,700 to 4,800 customers. Use these values directionally until exact credit-band data is obtained.

Prioritize three actions before expanding the analysis.

Use the dashboard as a directional view, then move to a clean, unfiltered extract with definitions attached.

Decision principle

Validate the model before scaling the analysis.

01 Validate the model

Reconcile the duplicated city KPI, confirm whether the dashboard is filtered to Software Engineers throughout, and obtain exact state-level and credit-band data.

02 Design a retention test

Segment the 60% non-existing group by product need, eligibility, and next-best offer before targeting conversion.

03 Review risk concentration

Investigate the large 300–499 score band and pair any lending action with affordability, underwriting, and collections guardrails.
